Quicksort

- Problem: Given a set of values, arrange them from smallest to largest
- The sorting problem is popular in computer science for several reasons:
 - Humans like ordered information
 - There are many techniques to solve the problem
 - These solutions provide examples of different algorithm techniques
 - Different solutions give opportunities to study algorithm complexity

Java Sorting

Sorting Techniques

Sorting

Java Sorting

Arrays Sorting

List Sorting

compareTo

Comparator

Selection Sort

Insertion Sort

Merge Sort

Quicksort

- Java's built-in `Arrays` and `Collections` classes provides a sorting method for arrays and lists
- Sorting arrays with primitive types uses quicksort algorithm
- Sorting lists and arrays with objects uses mergesort algorithm
- Both of these are efficient algorithms – the number of comparison/copy operations is minimized

Java Arrays Sorting

Quicksort

Method sort in Class Arrays	Behavior
<code>public static void sort(int[] items)</code>	Sorts the array <code>items</code> in ascending order.
<code>public static void sort(int[] items, int fromIndex, int toIndex)</code>	Sorts array elements <code>items[fromIndex]</code> to <code>items[toIndex]</code> in ascending order.
<code>public static void sort(Object[] items)</code>	Sorts the objects in array <code>items</code> in ascending order using their natural ordering (defined by method <code>compareTo</code>). All objects in <code>items</code> must implement the <code>Comparable</code> interface and must be mutually comparable.
<code>public static void sort(Object[] items, int fromIndex, int toIndex)</code>	Sorts array elements <code>items[fromIndex]</code> to <code>items[toIndex]</code> in ascending order using their natural ordering (defined by method <code>compareTo</code>). All objects must implement the <code>Comparable</code> interface and must be mutually comparable.
<code>public static <T> void sort(T[] items, Comparator<? super T> comp)</code>	Sorts the objects in <code>items</code> in ascending order as defined by method <code>comp.compare</code> . All objects in <code>items</code> must be mutually comparable using method <code>comp.compare</code> .
<code>public static <T> void sort(T[] items, int fromIndex, int toIndex, Comparator<? super T> comp)</code>	Sorts the objects in <code>items[fromIndex]</code> to <code>items[toIndex]</code> in ascending order as defined by method <code>comp.compare</code> . All objects in <code>items</code> must be mutually comparable using method <code>comp.compare</code> .

Java List Sorting

Arrays Sorting

List Sorting

compareTo

Comparator

Selection Sort

Insertion Sort

Merge Sort

Quicksort

Method sort in Class Collections

```
public static <T extends Comparable<T>>  
void sort(List<T> list)
```

Behavior

Sorts the objects in `list` in ascending order using their natural ordering (defined by method `compareTo`). All objects in `list` must implement the `Comparable` interface and must be mutually comparable.

```
public static <T> void sort  
(List<T> list,  
Comparator<? super T> comp)
```

Sorts the objects in `list` in ascending order as defined by method `comp.compare`. All objects must be mutually comparable.

compareTo Example Class

Sorting Techniques

Sorting

Java Sorting

Arrays Sorting

List Sorting

compareTo

Comparator

Selection Sort

Insertion Sort

Merge Sort

Quicksort

```
public class Person implements Comparable<Person> {
    // Data Fields
    /* The last name */
    private String lastName;
    /* The first name */
    private String firstName;
    /* Birthday represented by an int from 1 to 366 */
    private int birthDay;

    // Methods
}
```

compareTo Example Method

Sorting Techniques

Sorting

Java Sorting

Arrays Sorting

List Sorting

compareTo

Comparator

Selection Sort

Insertion Sort

Merge Sort

Quicksort

```
/** Compares two Person objects based on names. The
    result is based on the last names if they are
    different, using first names as a tie-breaker.
    @param obj The other Person
    @return A negative int if this person's name
            precedes the other person's name;
            0 if the names are the same;
            a positive int if this person's name follows
            the other person's name.
 */
@Override
public int compareTo(Person other) {
    // Compare this Person to other using last names.
    int result = lastName.compareTo(other.lastName);
    // Compare first names if last names are the same.
    if (result == 0)
        return firstName.compareTo(other.firstName);
    else
        return result;
}
```

Comparator Example Class

Sorting Techniques

Sorting

Java Sorting

Arrays Sorting

List Sorting

compareTo

Comparator

Selection Sort

Insertion Sort

Merge Sort

Quicksort

```
import java.util.Comparator;

public class CmpPerson implements Comparator<Person> {
    /** Compare two Person objects based on birth date.
     * @param left The left-hand side of the comparison
     * @param right The right-hand side of the comparison
     * @return A negative int if the left person's birthday
     *         precedes the right person's birthday;
     *         0 if the birthdays are the same;
     *         a positive int if the left person's birthday
     *         follows the right person's birthday.
     */
    @Override
    public int compare(Person left, Person right) {
        return left.getBirthDay() - right.getBirthDay();
    }
}
```

Selection Sort

Selection Sort

Algorithm

Insertion Sort

Merge Sort

Quicksort

- Selection sort is a simple sorting algorithm
- Given an array, it will reorder the values from smallest to largest
- Look through the entire array for the smallest value, and swap that value to the front
- Repeat this operation with the remaining array
- Stop when there are no remaining values

Algorithm

Selection Sort

Selection Sort

Algorithm

Insertion Sort

Merge Sort

Quicksort

SELECTIONSORT(A)

```
1: for fill in 0 to A.length-2 do
2:   posMin ← fill
3:   for next in fill to A.length-1 do
4:     if A[next] < A[posMin] then
5:       posMin ← next
6:   swap A[posMin] with A[fill]
```

Insertion Sort

Insertion Sort
Algorithm

Merge Sort

Quicksort

- Insertion sort is another simple sorting algorithm
- Given an array, it will reorder the values from smallest to largest
- Select a value in the unsorted array and shift values in the sorted array to make room for it
- Repeat this operation with the remaining values
- Stop when there are no remaining values

Algorithm

Sorting
Techniques

Selection Sort

Insertion Sort

Insertion Sort

Algorithm

Merge Sort

Quicksort

INSERTIONSORT(A)

- 1: **for** all elements e of A **do**
 - 2: $\text{nextPos} \leftarrow$ location of e
 - 3: **while** $\text{nextPos} > 0$ and element at $\text{nextPos} - 1 > e$ **do**
 - 4: shift element at $\text{nextPos} - 1$ to nextPos
 - 5: decrement nextPos
 - 6: insert e at nextPos
-

Selection Sort

Insertion Sort

Merge Sort

Merge Sort

Merge

Merge Algorithm

Merge Sort

Quicksort

- Merge sort is less straightforward to describe
- It runs more efficiently than insertion or selection sort though – fewer steps to sort the same array
- Split the array in half
- Sort the left half
- Sort the right half
- Merge the two halves to give a fully sorted array

Merge Operation

Sorting
Techniques

Selection Sort

Insertion Sort

Merge Sort

Merge Sort

Merge

Merge Algorithm

Merge Sort

Quicksort

- A *merge* operation is a common data processing operation
- Two lists are given, each of which is sorted on its own
- The merge operation “zips” these lists together
- The result is one large list that is fully in order

Merge Algorithm

Sorting
Techniques

Selection Sort

Insertion Sort

Merge Sort

Merge Sort
Merge

Merge Algorithm
Merge Sort

Quicksort

MERGE(A, B)

- 1: **while** both A and B have values left **do**
 - 2: add smaller of front value of A and B to C
 - 3: access next value of A or B, whichever was smaller
 - 4: copy remaining values in A to C
 - 5: copy remaining values in B to C
 - 6: **return** C
-

Merge Sort

Sorting

Quicksort

Partition Algorithm

Quicksort

- Quicksort shares some features with merge sort
- It usually runs more efficiently than insertion or selection sort as well
- Partition the array into two pieces based on a pivot value
- Sort the left piece
- Sort the right piece

Partition Algorithm

Sorting
Techniques

Selection Sort

Insertion Sort

Merge Sort

Quicksort

Quicksort

Partition Algorithm

Quicksort

PARTITION(table, first, last)

- 1: pivot \leftarrow table[first]
 - 2: up \leftarrow first, down \leftarrow last
 - 3: **while** up < down **do**
 - 4: increment up until table[up] > pivot
 - 5: decrement down until table[down] < pivot
 - 6: **if** up < down **then**
 - 7: swap table[up] and table[down]
 - 8: swap table[first] and table[down]
 - 9: **return** down
-

Sorting
Techniques

Selection Sort

Insertion Sort

Merge Sort

Quicksort

Quicksort

Partition Algorithm

Quicksort

- One single partition operation isn't enough to sort everything
- It puts the pivot in the proper place, but the two partitions might still be scrambled
- Use recursion to run quicksort on both parts of an array after partitioning it
- Note that the pivot is not guaranteed to be in the center
